Mission Control:
where it's at, and where it could go

Hey Lars! I had a proper dig through Mission Control. Here's what I loved, what I tidied up, how it all hangs together, and a heap of ideas for what's next.

The quick version

- **Mate, this is a really good idea.** Seven AI agents, each with its own job, in a slick Brandboy-branded command centre. You've nailed the concept.
- **I've done a bit of tidying under the bonnet.** Your AI account is now locked behind a passcode, the code's cleaned up, and I've given Claude some "safety rails" so you can't break anything.
- **You can keep building it yourself** just by chatting to Claude in plain English. No coding. Nothing goes live until you say so, and nothing ever gets lost.
- **There's some really fun stuff we could do next:** agents that find real tenders on the web, remember your clients, and send you a morning brief with your coffee.

1 What you've built

Mission Control is one web page where you hand tasks to a team of AI specialists. Each one is Claude (Anthropic's AI) with its own role and instructions. Here's the crew:

🔍
SCOUT
Finds and researches prospects

✍️
COMPOSER
Writes outreach emails and follow-ups

🎯
HUNTER
Tenders, DAs, project opportunities

⚙️
OPS
Checklists, suppliers, risk registers

📈
RANKR
SEO for brandboy.com.au

🗂️
NEXUS
Pipeline and lead scoring

What I really like about it

✓ The idea is spot on
Giving each agent a name and a clear job is exactly how people get real value out of AI. Way better than one big chat box.

✓ It looks the part
Strong Brandboy branding, that dark "command centre" vibe, and the one-click quick tasks make it really easy to pick up and use.

✓ Good security instincts
You'd already moved the Anthropic key off the page and into a server function. Honestly, loads of people miss that one. Nice work.

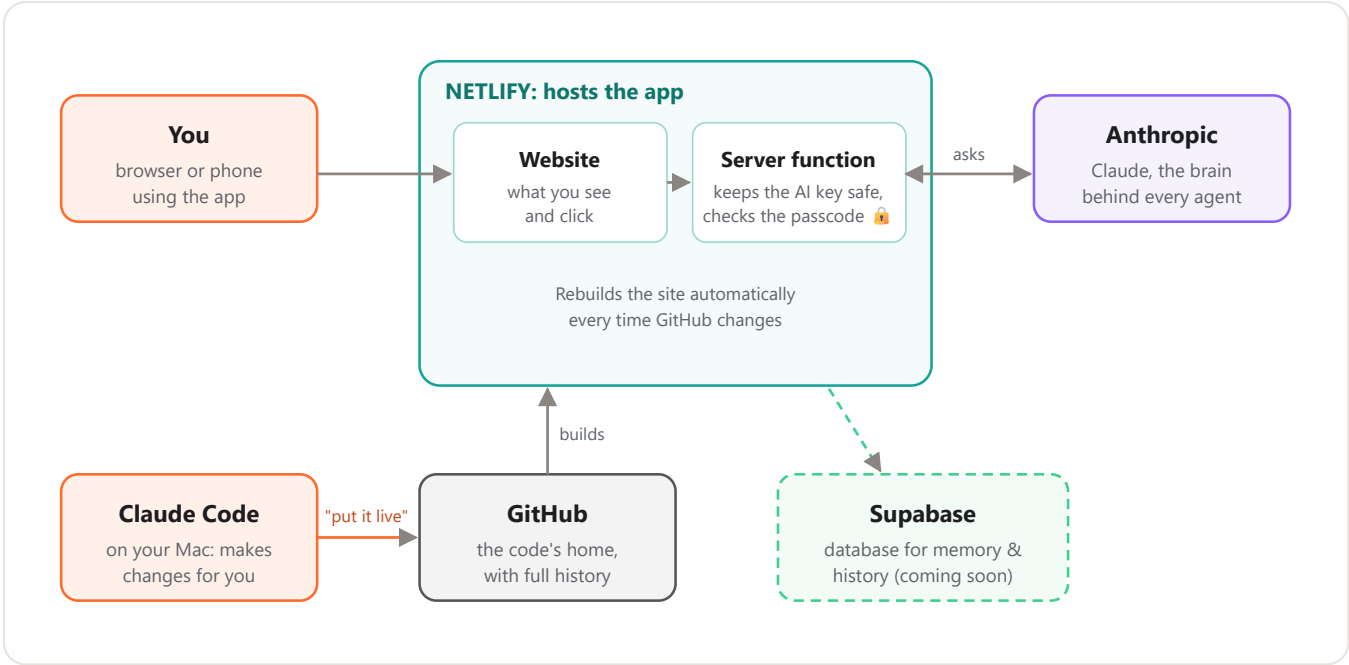

✓ Solid foundations
GitHub, Netlify, Supabase and React are the same tools the pros use. Nothing needs ripping out; I'm just building on what you've got.

✓ You've got a plan
The Strategy page spells out who does what and when. It's a great roadmap for turning these agents into a proper sales machine.

✓ Ready to grow
You've already set up the database with tables for agent memory and an activity log. That's the next step teed up.

2 How it all hangs together

There are five services working together behind the scenes. Here's what each one does, no jargon.

SERVICE	WHAT IT DOES
GitHub	Where the code lives. Think Dropbox for code, except it keeps every version you've ever saved, so you can always go back.
Netlify	Your web host. Every time GitHub changes, Netlify rebuilds the site and puts it live (dreamy-taffy-27a291.netlify.app). It also runs the little "server function" that keeps your Anthropic key out of sight.
Anthropic	The company behind Claude. Every agent answer comes from them, charged per use to your Anthropic account.
Supabase	Your database. It's set up and ready to go, and will hold agent memory, chat history and the activity log once there's a proper login.
Claude Code	Claude as your developer, on your own computer. You tell it what you want; it makes the change, checks it works, and saves it.

3 What I've tidied up

All "under the bonnet" stuff. The app looks exactly the same, but it's safer, easier to change, and ready for the fun bits.

WHAT	WHY IT MATTERS	
Passcode on the AI connection	This is the big one. The AI connection was open to anyone who stumbled on it, and they could've run up your Anthropic bill. Now it needs your passcode, and the agent instructions and AI model are locked in on the server. You only type the passcode once per device.	Done
All the agents in one spot	Names, instructions, colours and quick tasks now live in one file (`agents.js`). Adding or tweaking an agent is now a one-file job.	Done
Memory & Activity Log fixed up	These files had landed in a folder with a funny name, so they'd been switched off. They're sorted now and ready to turn on once there's a login.	Done
Readable code	The main screen was crammed into some very long lines, so it was hard to see what changed. It's all neatly laid out now and stays tidy automatically.	Done
Keys out of the code	Connection details now live in settings, not in the code, so they can't end up on GitHub by accident.	Done
Cleared out the leftovers	Binned the template files from the original setup and wrote a README that explains how to run and change things.	Done
Claude Code with safety rails	Set Claude up to talk to you in plain English, plus some automatic checks (more on the next page).	Done

What's not there yet (totally normal at this stage!)

The agents can't search the web yet

Heads up on this one: if you ask HUNTER for "live tenders", it'll write convincing ones, but they're **made up**. Until we add web search, treat research as ideas to check, not gospel.

They forget things

Chats disappear when you refresh, and the agents don't remember past chats or your clients. Memory's the next big step.

"24/7" is the goal, not yet the reality

Right now the agents only work while you're chatting to them. Morning reports, auto follow-ups and tracking opens are on the list.

Long answers get cut short

Answers are capped to fit the host's time limit. "Streaming" (words appearing as they're written) fixes that and feels much snappier too.

4 How you can keep building it

You don't need to code at all. You tell Claude what you want, have a look, and decide if it goes live. That's it.

How it works

1. **Just ask.** "Add an agent that writes quotes." "COMPOSER's emails are too long."
2. **Claude tells you the plan** in a few lines. You say yes (or tweak it).
3. **Claude makes the change**, checks nothing's broken, and makes a **save point**.
4. **You have a look** on your own computer first. Claude tells you what to click.
5. **"Put it live"** and it's on the website a couple of minutes later.
   "Undo that" and it's back how it was.

Safety rails (always on)

🔑 **No keys in the code.** Claude physically can't write a secret key into a file.

✅ **Can't finish with it broken.** Claude can't say "done" until the site builds and the work's saved.

🙋 **Nothing goes live without you.** Claude always checks with you first.

♻️ **Nothing gets lost.** Deleting work is blocked, and every version is kept.

Who does what

YOU, WITH CLAUDE	GIVE ME A SHOUT
New agents, tweaking how agents write, quick tasks, wording, colours, layout, and the "small" ideas on the next page	Logins, the database, anything with money or emails going out, hooking up other systems (CRM, Gmail), or any time Claude says "this is a bigger change"

> *A few good habits: one change at a time · always have a look before "put it live" · never paste a key into the chat · if in doubt, make a save point first.*

5 Ideas to make it even better

A bunch of ideas, grouped up. Small = an hour or two · Medium = about a day · Large = a few days. ★ = where I'd start.

What the agents can do

★ **A Brandboy company brief**	One shared page every agent reads: your services, regions, typical jobs, past clients, how you like to sound. Biggest bang for buck by far.	Small
★ **Real web search**	SCOUT, HUNTER and RANKR find *real* tenders, companies and keywords, with links so you can check.	Medium
Memory	Agents remember past chats and facts ("we already reached out to Westfield").	Medium
Hand-offs	"Send SCOUT's list to COMPOSER" and boom, emails drafted for each prospect.	Medium
Read your documents	Drop in a tender PDF or brief and ask an agent about it.	Medium
Morning brief	New tenders and follow-ups due, in your inbox every morning. This is what makes "24/7" real.	Large
Gmail / CRM hook-up	Agents prep the emails and pipeline updates; you approve and hit send.	Large

Everyday use

★ **Chats stick around**	They survive a refresh, plus a "New chat" button.	Small
★ **Copy button on replies**	One click to grab an email or list and paste it anywhere.	Small
★ **Nicely formatted answers**	Proper headings, bullets and tables instead of stray symbols.	Small
Stop / retry buttons	Plus friendlier error messages.	Small
Activity Log switched on	See what each agent's been up to (once there's a login).	Small

Look and feel

Works great on your phone	Sidebar turns into a menu, so you can use it on site.	Medium
★ **Easier on the eyes**	Slightly bigger text and a bit more contrast.	Small
Strategy page as a tracker	Tick things off and watch the progress.	Medium
Saved outputs panel	Keep your best lists and emails next to the chat to reuse.	Medium

Behind the scenes

Proper login	An email-link login just for you. Replaces the passcode and unlocks memory and history.	Medium
Streaming answers	Words appear as they're written; no more cut-off answers.	Medium
Automatic checks before going live	A broken change can never hit the website, plus preview links to try things.	Small
Spending controls	A monthly cap on the Anthropic account, and cheaper repeat requests.	Small

6 Where to from here

No pressure on any of this. You pick the pace and how hands-on you want to be.

Now

Get the security fix and Claude setup live. We set up Claude Code on your Mac together, and you make your first change (a new agent is a fun one to start with).

Next couple of weeks

You and Claude: the company brief, copy buttons, chats that stick around, formatted answers, easier-to-read text.

After that

I'll do login + memory, streaming answers and web search. Then hand-offs, documents, the morning brief and the phone layout.

Stuff to chat about on Wednesday

1. Which agents do you actually use the most? Any answers that have let you down?
2. Is the website link shared with anyone else, or is it just you?
3. Where do your prospects and contacts live now: a spreadsheet, a CRM, your inbox?
4. Do you want to have a crack at changes yourself, or would you rather I make them and you check them? Honestly, either is totally fine, and I'm happy to do any of it.
5. What sort of monthly AI spend feels comfortable?

Bits I'll sort before then

- [ ] Add your passcode to the Netlify settings before the update goes live
- [ ] Set a monthly spend cap on the Anthropic account and check recent usage
- [ ] Double-check the database security settings in Supabase

Any questions, just give me a bell. Looking forward to Wednesday! Eric
